

FEAST 2019

The 2019 Workshop on Forming an ecosystem Around Software Transformation (FEAST 2019) will be held in conjunction with the 26th ACM Conference on Computer and Communications Security (CCS) on November 15th, 2019. The workshop is geared toward discussion and understanding of several critical topics surrounding software executable transformation for improving the security and efficiency of all software used in security-critical applications. The scope of discussion for this workshop will include topics that may be necessary to fully exploit the power and impact of late-stage software customization efforts.

Call for Papers

Typical software engineering methodologies are largely focused on programmer productivity and their methods have been known to introduce significant execution inefficiency as a side effect. Recent work investigating efficient and timely software has attempted to enhance software execution efficiency while preserving the source code-level abstractions and object-orientation that enhance a programmer's productivity.

Such efforts seek to undo the side effects on security and performance overhead by reclaiming software execution efficiency and reducing indirection, as well as performing automatic program de-layering and program specialization (de-bloating). Several promising results from these efforts have demonstrated their viability in improving program execution efficiency as well as reduction of the cyber security attack surface. As a result, the community may benefit by investing in the development of tool ecosystems to take advantage of this recent progress, to mature the technologies, and determine how best to transparently deploy them.

Despite some early progress within the research community, software executable transformation is not a solved science. Some critical problems of reverse engineering and binary understanding are, in the general case, undecidable. Various automated tools and ecosystems will need to be investigated and developed to guarantee the effectiveness and correctness of transformation efforts and to enhance and ensure the security of transformed software. The FEAST workshop will include topics geared toward:

- Understanding issues of software executable transformation for various programming

languages and environment, and the potential methods for alleviating those issues.

- Identification of tools to be investigated and developed for guaranteeing correctness, enhancing security, and enabling non-critical/undesired feature removal
- Identification of layers and areas of computing systems that are suitable for and can benefit from software customization/transformation, along with the identification of associated challenges and constraints, and the particular adaptation to the methodology needed to operate within the identified areas
- Automated extraction of models from software executables that are amenable to formal methods analysis and verification

Submissions should be in two-column, 10-point format, double-blind, and can be up to 6 pages in length with as many additional pages as necessary for references. Detailed submission instructions can be found at <https://feast19.hotcrp.com>

Important Dates

- **July 2nd, 2019** AOE Submission Deadline
- **August 5th, 2019** Notification
- **August 30th, 2019** Camera Ready Deadline
- **November 15th, 2019** Technical Program

Organization Committee

Program Committee Chairs

- Adam Doupe, Arizona State University
- Zhiqiang Lin, The Ohio State University

Program Committee Members

- Alexandros Kapravelos, NC State University
- Aravind Prakash, SUNY Binghamton
- Byoungyoung Lee, Seoul National University
- Chao Wang, University of Southern California
- Dinghao Wu, The Pennsylvania State University
- Eric Schulte, GrammaTech, Inc.
- Guru Prasad Venkataramani, The George Washington University
- Jiang Ming, University of Texas at Arlington
- Kevin Hamlen, University of Texas at Dallas
- Maverick Woo, Carnegie Mellon University
- Nick Nikiforakis, Stony Brook University
- Suman Jana, Columbia University
- Taesoo Kim, Georgia Tech
- Tian Lan, The George Washington University
- Vasileios P. Kemerlis, Brown University
